AxiomWeave AlphaLedger

PROOF BEFORE PROFIT

An abstention-first, defined-risk options agent

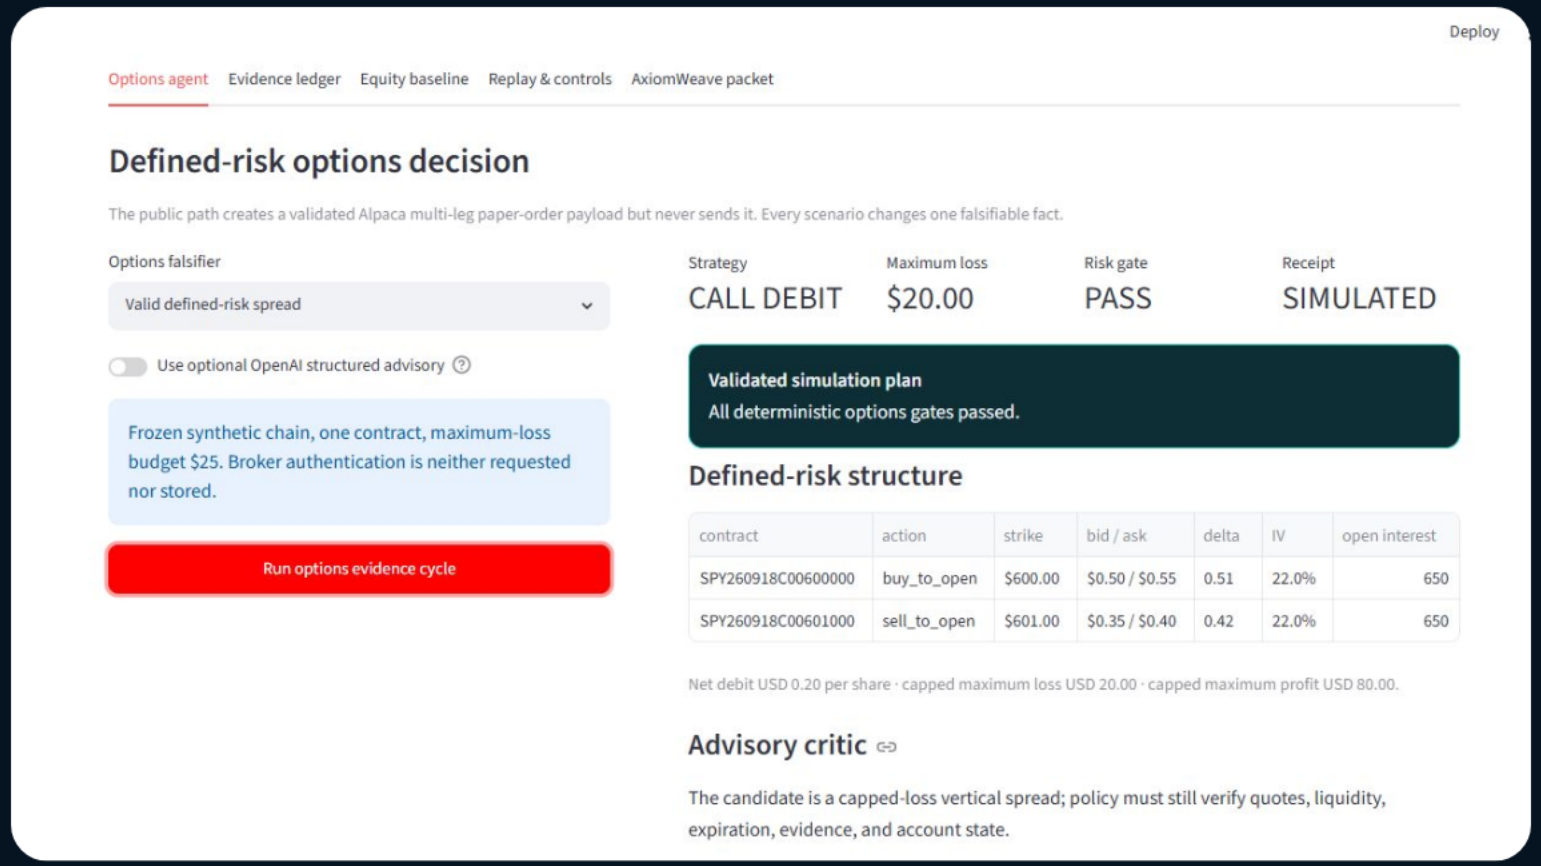

Prediction is easy to demo. Refusal is hard to prove.

Options turn one stale quote or understated debit into a different risk.

But a real user still needs to know:

1. **Are both quotes, Greeks, and liquidity valid?**
2. **Was maximum loss recomputed from the legs?**
3. **Can the model veto without authorizing?**

AlphaLedger turns every decision into a falsifiable receipt

1 **Name both option legs**

2 **Recompute capped loss**

3 **Gate before a plan**

The public demo is simulation-only and requests no credentials.

HOW IT WORKS

One governed loop keeps AI advisory

The adviser may veto. Only quote-derived deterministic policy can permit a plan.

The public path validates Alpaca’s multi-leg order shape but never sends it.

Change one fact; the same candidate stops

12 s

evidence age

PASS

simulated receipt

900 s

evidence age

ABSTAIN

rejection receipt

Six controls outrank every model score

01 — paper only; exact account and one writer

02 — complete, fresh data with valid Greeks

03 — 10:20–14:30 ET; one attempt per day

04 — $250 plan / $500 day / $1k total loss caps

05 — 45-minute hold; +25% / −20% exit triggers

06 — Thu 15:45 ET flat; EOD Thursday equity scored

MODEL

veto only

POLICY

execution authority

The evidence ceiling is visible, not buried

C0 | **C1** | C2 | C3 | C4 | C5 | C6

C1 · mechanics on frozen synthetic + Alpaca-shaped inputs

102 tests pass ≠ **options alpha proven**

No tested signal cleared its held-out promotion gate

INCIDENT • AUGUST 31

An incomplete catalog stopped new entries

BUSINESS VALUE

A trust layer for AI options workflows

WHO IT COULD SERVE

Brokerages
Fintech platforms
Wealth tools
Agent developers

WHAT WE OFFER

Quote-derived provenance

Why these legs, economics, and outcome?

Fail-closed planning

No model-direct path to a broker payload.

Audit-ready replay

Passes and abstentions share one ledger.

PAPER
